# Membuat Private Nameserver

Berikut ini adalah tutorial bagaimana cara membuat private nameserver menggunakan [paket dns management](#)

## Contoh private nameserver

The screenshot shows the intoDNS website interface. At the top, there is a search bar with the URL <https://intodns.com/autoreg.my.id> and a search button. Below the search bar is the intoDNS logo with the word 'beta' next to it. A message 'Work in progress! Follow IntoDNS on [Twitter](#)' is displayed. Below this is a table with the following data:

| Category | Status                                                                            | Test name         | Information                                                                                                                                                                                                                                                                                       |
|----------|-----------------------------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent   |  | Domain NS records | <p>Nameserver records returned by the parent servers are:</p> <p>ns1.autoreg.my.id. ['15.235.73.242'] [TTL=3600]<br/>ns2.autoreg.my.id. ['51.79.130.245'] [TTL=3600]<br/>ns3.autoreg.my.id. ['103.150.86.136'] [TTL=3600]</p> <p><b>c.dns.id</b> was kind enough to give us that information.</p> |

Setelah anda melakukan pemesanan paket dns selanjutnya lakukan berikut ini :

## Membuat Child Nameserver

Untuk membuat child nameserver anda harus mendapatkan ip address dari nameserver kami. Adapun ns kami yaitu

```
ns1.irza.net ip address = 15.235.73.242
ns2.irza.net ip address = 51.79.130.245
ns3.irza.net ip address = 103.150.86.136
```

Silahkan anda membuat child nameserver di tempat anda membeli domain dengan ip tersebut.

## Membuat A Record

Selanjutnya anda membuat A record di DNS Managemen kami dan pointing ke ip berikut ini

Contoh

```
ns1.domainanda.com. A 15.235.73.242
ns2.domainanda.com. A 51.79.130.245
ns3.domainanda.com. A 103.150.86.136
```

## Ubah Nameserver Domain

Tunggu sekitar 60 menit dan apabila semua tahapan sudah benar, selanjutnya silahkan ubah nameserver ke nameserver private domain anda tersebut.

Itulah tadi tahapan cara membuat private nameserver dan semoga bermanfaat.
