Instalasi NFS Server di Centos 7

Berikut ini adalah tahapan instalasi nfs server untuk file shared remote di centos 7

Pengantar

Kita asumsikan bahwa kita telah menyediakan 2 server yaitu

1. server-data.jux.in (192.168.0.100)
2. client.jux.in (192.168.0.101)

Instalasi NFS Server

Tahap pertama jalankan

```
yum install nfs-utils -y
```

apabila instalasi sudah selesai, lanjut membuat folder data

```
mkdir /var/data_share
```

```
chmod -R 755 /var/data_share chown nfsnobody:nfsnobody /var/data_share
```

selanjutnya jalankan service nfs agar otomatis aktif setiap kali server reboot

```
systemctl enable rpcbind
systemctl enable nfs-server
systemctl enable nfs-lock
systemctl enable nfs-idmap
systemctl start rpcbind
systemctl start nfs-server
systemctl start nfs-lock
systemctl start nfs-idmap
```

Setting Sharing

Selanjutnya membuat konfigurasi sharing data ke server client

```
nano /etc/exports
```

isi dengan

```
/var/data_share    192.168.0.101(rw,sync,no_root_squash,no_all_squash)
```

kemudian restart nfs server

```
systemctl restart nfs-server
```
